PRODUCT SPECIFICATION

Sushruth

Current Feature Inventory, User Workflows and System Flow Diagrams

Scope: Patient, doctor, child health, family care, OCR, AI triage, records, accessibility and emergency workflows
Current update: Stress-level slider removed from the Health Tracker daily log
Prepared: 4 September 2026

Document overview

This document describes the functionality currently present in the Sushruth AI healthcare assistant. It separates implemented workflows from important boundaries and avoids presenting AI output as diagnosis or medical advice.

> **Latest Health Tracker change:** the stress-level slider has been removed. New daily logs retain date, water, sleep, activity, mood and symptoms. No hidden default stress score is submitted. Older stress values remain readable in historical entries.

Contents

1. Authentication and portal selection
2. Patient onboarding
3. Indian-language support
4. Accessibility
5. Patient dashboard
6. AI symptom triage
7. Pre-Consultation case-taking
8. Medical Reports
9. Prescriptions
10. Health Records
11. Health Tracker
12. Medications
13. Appointments and clinic search
14. Child Health
15. Care Circle
16. Caretaker/Nurse area
17. Doctor portal
18. Privacy and emergency access
19. System architecture
20. Current implementation boundaries

1. Authentication and portal selection

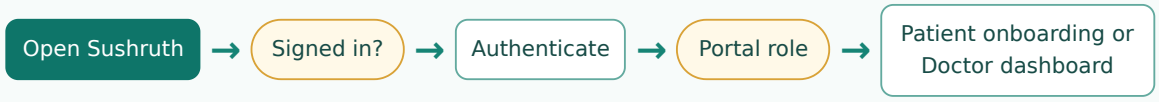

Authentication

- Clerk registration and sign-in
- Authenticated patient and doctor routes
- Session-aware client cache clearing
- Responsive sign-in and sign-up experience

Portal routing

- Patient or Doctor portal selection
- Role-specific navigation and dashboards
- Patient onboarding checks
- Existing users default to the Patient portal

Entry workflow

2. Patient onboarding

Wellness questionnaire

The initial questionnaire covers age group, known conditions, current feeling, sleep, general stress, energy, eating habits, physical activity, mental-wellbeing factors and the patient’s main health goal.

Its AI wellness snapshot can include a general summary, daily recommendations, sleep/stress/energy observations, goal reminder and an overall wellness score. Questionnaire answers and analysis are cached in the user’s browser.

Language onboarding

- Selection from 22 Indian languages
- Native-script language names
- Per-user persistence
- RTL handling for Kashmiri, Urdu and other configured RTL languages

Patient onboarding

3. Indian-language support

English Hindi Bengali Telugu Marathi Tamil Urdu Gujarati Kannada Malayalam Odia
Punjabi Assamese Maithili Sanskrit Nepali Konkani Manipuri Sindhi Kashmiri Bodo Santali

Language-aware capabilities

- Localized shared navigation and major patient-feature labels
- Kashmiri RTL; Bodo and Santali LTR
- Language persistence across navigation and reload
- Language-aware AI triage, report simplification, prescription interpretation, document analysis and wellness results
- Localized Pre-Consultation stages for Kashmiri, Bodo and Santali
- Speech-recognition locale selection and text-to-speech voice matching
- Typed-input fallback where regional speech recognition is unavailable

Browser dependency: speech recognition and speech synthesis rely on engines and voices installed by the browser/device. Native Kashmiri, Bodo or Santali speech cannot be guaranteed on every device.

4. Accessibility

Navigation

- Responsive desktop/mobile navigation
- Skip-to-content link
- Keyboard focus indicators
- Semantic main navigation
- Keyboard shortcuts and direct navigation

Reading support

- Speak on focus or hover
- Read-page control
- Language-aware voice matching
- Visible text remains available if speech is unsupported
- Dark and light themes

Reading-assistance flow

5. Patient dashboard

The dashboard reads current information from application APIs and summarizes:

- Recent triage sessions
- Upcoming appointments
- Active medications
- Care Circle alerts
- Wellness information and personalized greeting
- Quick links to primary workflows
- Loading and empty states

6. AI symptom triage

Input

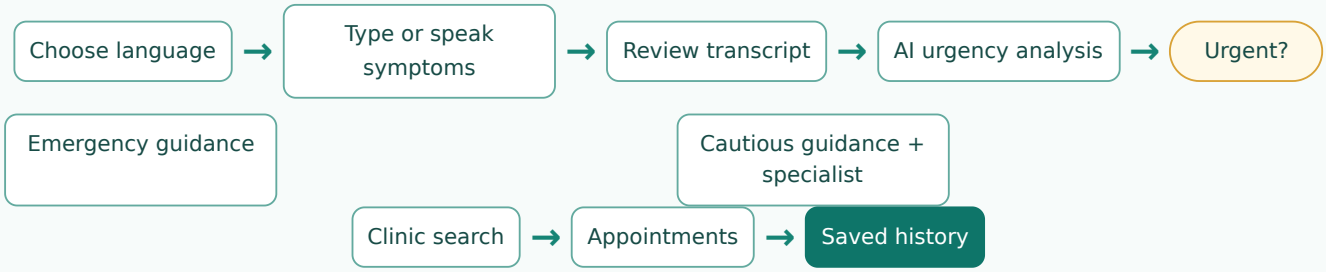

- Typed symptom description
- Regional-language selection
- Browser speech recognition
- Transcript review, edit and retry
- Speech-confidence handling

Result

- Urgency level
- Recommended medical specialty
- Plain-language explanation
- Suggested next action
- Safety guidance
- Nearby clinic and appointment actions

Results are stored in triage history and can be reviewed or deleted. The AI is instructed not to diagnose or prescribe. Potential emergencies receive stronger escalation guidance.

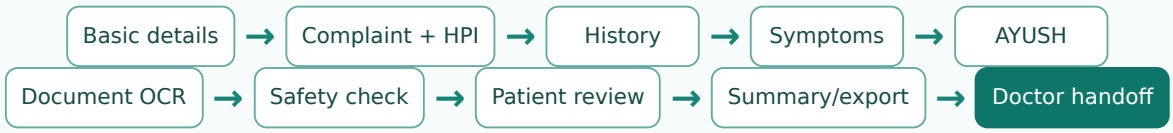

AI triage workflow

7. Pre-Consultation patient case-taking

Stage	Information and actions
1. Basic information	Age, gender, selected patient language and basic demographic context.
2. Main problem	Primary complaint, onset, severity and voice-assisted text entry.
3. Medical history	Existing conditions, medicines, allergies and lifestyle information.
4. Detailed symptoms	Category, location, character, timing, severity and associated details.
5. AYUSH history	Appetite, sleep, bowel habits, Nidana/triggers, Prakriti, Vyayamashakti and Sattva.
6. Previous documents	Camera/file upload and OCR for reports and prescriptions.
7. Safety screening	Structured emergency questions and red-flag review.
8. Patient review	Review the complete patient-entered history before continuing.
Final summary	Structured summary, disclaimer, PNG/PDF export, Health Records shortcut, destination selection and explicit send confirmation.

Pre-Consultation workflow

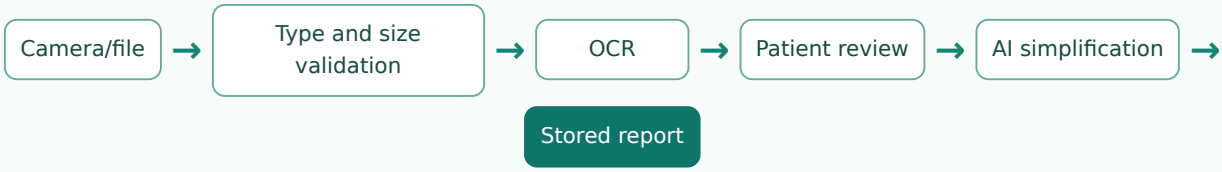

Clinical wording: the summary contains patient-reported information, not a diagnosis. A certified clinician must verify it.

8. Medical Reports

- Add, categorize, view and delete reports
- Manual text entry, camera capture or image upload
- OCR text extraction
- AI plain-language simplification
- Abnormal-value presentation and suggested specialist category
- Language-aware explanation while preserving raw names, values, dates and units
- Authenticated ownership protection

Report categories: blood test, urine test, X-ray, MRI, CT, ECG, ultrasound, prescription, discharge summary and other.

Report processing

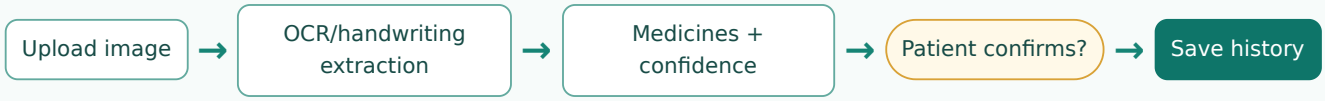

9. Prescriptions

- Printed and handwritten prescription uploads
- Camera/file input
- Prescriber, date, medicine, strength, dosage, frequency, duration and instruction extraction
- Confidence indicators and unclear-text warnings
- Patient review/edit before saving
- Prescription history with view, update and delete
- Ownership protection

> Unreadable text is marked “unclear” rather than invented. Extracted medicines do not automatically activate a medication schedule.

Prescription workflow

10. Health Records

Health profile

- Blood group
- Allergies
- Chronic conditions
- Current medications
- Emergency contact
- Height and weight

Surgery history

- Procedure
- Date
- Hospital and surgeon
- Notes
- Persisted records and deletion

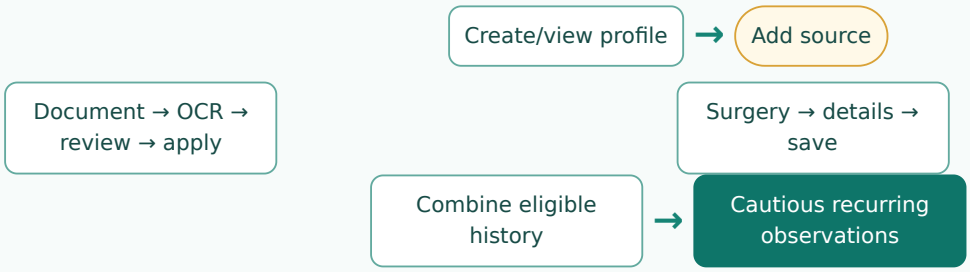

Medical-document analysis

Camera/file upload, OCR, medication extraction, language-aware summary, warnings, confidence indicators and patient-reviewed application to the profile.

Longitudinal observations

Eligible history can be combined to identify cautious recurring observations. Wording avoids diagnosis and causation, requires sufficient history and uses cached analysis where appropriate.

Health-record workflow

11. Health Tracker

Current daily log

Date **Water** **Sleep** **Activity** **Mood** **Symptoms**

Stress slider removed: new logs do not submit a stress score. Historical stress values remain visible when present.

History and insights

- Recent daily health timeline
- Weekly average sleep and hydration
- AI trend summary and cautious risk indicator
- Personalized tips based on available fields

Daily tracker workflow

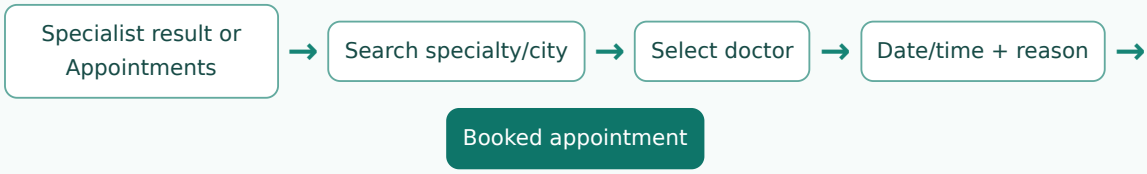

12. Medications

- Add medicine name, dosage, frequency, dates and instructions
- Active/inactive status and history
- Update, stop or delete a medication
- Dashboard integration
- Prescription OCR remains review-only and does not automatically create active medicines

13. Appointments and clinic search

- Browse and filter doctors by specialty and city
- View hospital information
- Select date/time and enter consultation reason
- Book and view upcoming/past appointments
- Update status or cancel
- Google Maps clinic search
- Location-based nearby search with manual fallback

Appointment workflow

Boundary: there is no payment, video consultation, hospital scheduling integration or real-time external slot inventory.

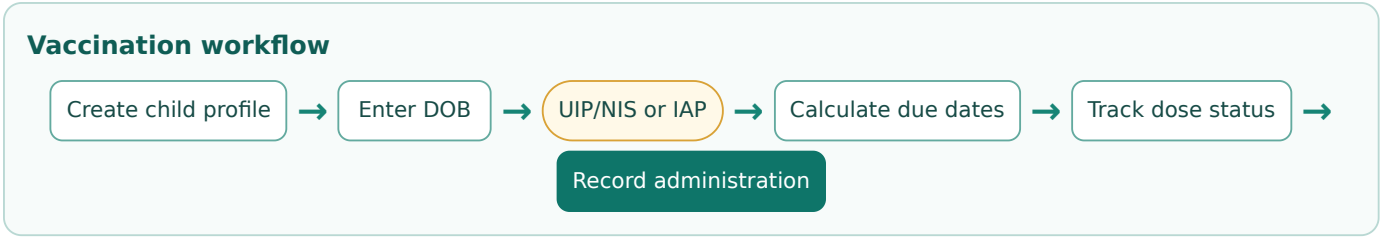

14. Child Health

Child and guardian profiles

- Name, date of birth, sex and blood group
- Guardian relationship and access levels
- Multiple linked guardians through Care Circle relationships

Vaccination tracking

- Separate UIP/NIS and IAP-ACVIP 2025 schedules
- DOB-derived dose dates
- Upcoming, due, overdue and completed states
- Administration date, provider, batch and notes
- Manual immunizations stored separately from generated schedule entries
- Responsive status dialog and duplicate-resistant schedule generation

Vaccination workflow
Create child profile
Enter DOB
UIP/NIS or IAP
Calculate due dates
Track dose status
Record administration

15. Care Circle

- Add family members and caregivers
- Relationship, role and linked-user tracking
- Member workspace and access management
- Assign duties and add daily-care logs
- Shared care history
- Medication-related care alerts
- Private caretaker-document vault
- Manual identity-verification submission
- Care-plan tracking

> Care alerts are generated when the relevant endpoint is read; this is not yet a background push-notification pipeline.

16. Caretaker/Nurse area

Registration

- Legal name and worker type
- Phone and agency
- Shift
- Assigned family member
- Duties

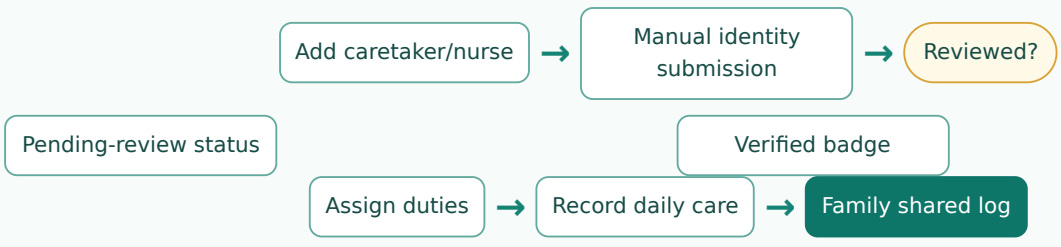

Workspace

- Assigned duties
- Shared daily-care logs
- Care Circle linkage
- Shift and agency details
- Verification status

Verification safeguards and private vault

- Manual verification only
- No claim of automated Aadhaar or police verification
- Badge shown only after a verified record state
- No full government ID number should be stored
- Validated private uploads with ownership checks and short-lived signed URLs

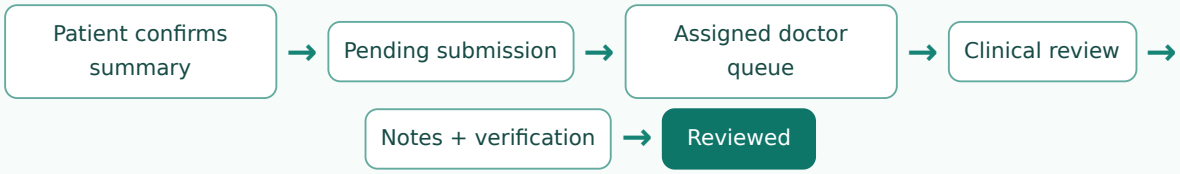

Care workflow

17. Doctor portal

- Doctor-specific dashboard
- Assigned Pre-Consultation queue
- Status filtering
- Review patient-reported summary, history, AYUSH data and documents
- Verification state and doctor notes
- Mark consultation reviewed
- Assigned-doctor ownership restrictions

Clinical handoff

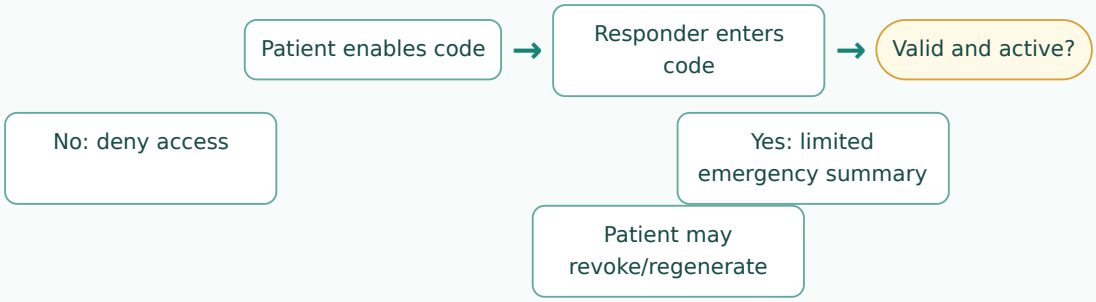

Boundary: the system does not yet provide an independent medical-license or clinic-admin verification authority. Production use should add verified organization-based credentialing and assignment.

18. Privacy and emergency access

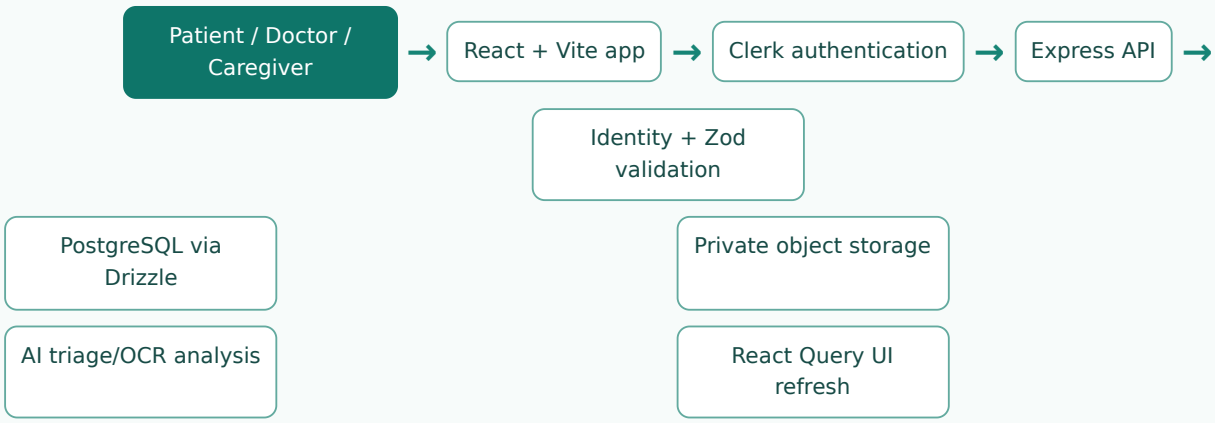

- Generate, regenerate and revoke an emergency access code
- Owner-only code-management actions
- Public lookup using a valid active code
- Limited emergency health, contact, Care Circle and recent triage context
- Clerk authentication and server identity matching for protected routes
- Guardian, assigned-doctor and Care Circle ownership checks
- Medical-image type and size validation
- Private-document signed URLs

Emergency access

19. Overall system architecture

Application architecture

Layer	Responsibility
React/Vite client	Responsive interfaces, forms, navigation, language, accessibility and workflow presentation.
Clerk	User authentication, signed-in state and route protection.
Express API	Validation, authorization, workflow orchestration and API responses.
PostgreSQL/Drizzle	Health, portal, appointment, child, vaccination and care records.
Object storage	Private uploaded documents using metadata and signed access URLs.
AI services	Non-diagnostic triage, OCR-assisted extraction, simplification and cautious observations.

20. Current implementation boundaries

- No hospital appointment-inventory integration
- No payments or video consultations
- No automated government-ID, police or medical-license verification
- No clinic/hospital organization administration
- No background push-notification service
- Ambulance 108 integration remains halted
- No comprehensive clinical audit-log system
- Dependency-security remediation remains incomplete

Core implemented areas: patient and doctor portals, onboarding, multilingual navigation, accessibility aids, symptom triage, Pre-Consultation, OCR-assisted reports and prescriptions, health records, daily tracker, medications, appointments, child vaccination, Care Circle, caretaker workflows and emergency-access management.

Sushruth is a health-information and care-coordination assistant. AI-generated content must not be treated as diagnosis, medical advice or a substitute for evaluation by a qualified healthcare professional.
